

functional morphology of neuroendocrine pdf

Insect morphology is the study and description of the physical form of insects. The terminology used to describe insects is similar to that used for other arthropods due to their shared evolutionary history. Three physical features separate insects from other arthropods: they have a body divided into three regions (head, thorax, and abdomen), have three pairs of legs, and mouthparts located ...

Insect morphology - Wikipedia

Enterochromaffin (EC) cells (also known as Kulchitsky cells) were discovered by Nikolai Kulchitsky of Karazin Kharkiv National University. They are a type of enteroendocrine and neuroendocrine cell. They reside alongside the epithelium lining the lumen of the digestive tract and play a crucial role in gastrointestinal regulation, particularly intestinal motility and secretion.

1. Introduction: zebrafish as a model for biomedical research. A small teleost fish, the zebrafish (*Danio rerio*) has rapidly become a promising model organism in biomedicine, as a low-cost and genetically tractable vertebrate species with high physiological and genetic homology to humans (Kalueff et al., 2014a, Kalueff et al., 2014b). Zebrafish morphology is strikingly similar to rodents ...
